Summary

Computer Science student and full-stack developer (Go, Vue, TypeScript, PostgreSQL). Through team-based university projects, I have built software for two real clients, from requirements gathering to deployment, and I independently develop tools with CI, testing and published releases. Strong foundation in compilers, operating systems and algorithms.

Real-Client Projects

Management System for Fundación Hannah
Academic team project · Non-profit organization *2026 – Present*

- Platform to manage patients, donations, events and volunteers, plus a public website for the foundation.
- Go, Vue and Supabase (database, authentication and file storage). In active development following formal software engineering phases.

Logistics Management System
Academic team project (1 year) · Transportation company *2025*

- Designed with the team a dynamic form subsystem: administrators add, edit or remove questions without code changes, and responses automatically generate price quotes.
- Employee, vehicle and order management with role-based access control. Go, Vue, PostgreSQL and Docker; deployed on AWS. Built using Scrum with Jira.

Personal Project

DiskFlow, Visual Storage Auditor
Individual project · github.com/DiegoOF07/Diskflow *2026*

- Desktop app that shows where disk space goes in a development workspace (dependencies, build artifacts) through a synchronized treemap and table.
- Concurrent scan engine in Go that indexes ~100k entries in ~2.4 s using under 10 MB of heap; local index stored in SQLite.
- Go, Wails, Vue 3 + TypeScript. CI with GitHub Actions, backend and frontend tests, automated releases and documented architecture decisions (ADRs).

Other Projects

MCP Client and Server from Scratch
Academic project · github.com/DiegoOF07/restaurant-mcp-server *2026*

- Hand-written implementation of the Model Context Protocol (JSON-RPC 2.0 framing and initialization handshake), without an SDK, for an assistant that answers questions about a restaurant's recipes, inventory and allergens.
- Go server and TypeScript client with SQLite; binaries published for five platforms with checksums.

Academic: Graph-based movie recommender (Go, Vue, Neo4j, TMDB API) · Route optimizer using a genetic algorithm (Python/FastAPI, React, Google Cloud) · Lexer and parser generator (Python, PySide6) · Raytracer and graphics engines from scratch (Rust).

Game Jam: Global Game Jam 2026: *Invitado especial*, a game built as a team in 48 hours (TypeScript, Vue, Phaser).

Skills

Programming: Go, TypeScript, JavaScript, Python, Rust, Java, C

Frontend: Vue, React, Vite

Backend: Go, FastAPI, Node.js/Express, REST APIs, Model Context Protocol

Databases: PostgreSQL, SQLite, Neo4j, MongoDB, MySQL, Supabase

Tools: Git, GitHub Actions, Docker, Linux, AWS, Google Cloud, Jira, Scrum

Education

Universidad del Valle de Guatemala
B.S. in Computer Science (expected graduation: 2027) *2023 – 2027*

Centro Educativo Técnico Laboral KINAL
Technical High School Diploma in Computer Science *2020 – 2022*

Languages: Spanish (native) · English (intermediate)
